Alexander Raviol

Mark Ritter

Stephan Steiger

The Portfolio Management Team has essentially been working together since 2007.

Investment Strategy

The Lupus alpha Volatility Risk-Premium is based on a smart option strategy that aims at collecting the volatility risk premium (implied-realised spread). The risk premium is economically justifiable, sustainable and can be collected via exchange-traded equity-index-options. Additionally, a tail hedge reduces risk during market phases with extreme levels of volatility. The core portfolio consists of short-dated euro bonds with a high quality rating. The strategy is implemented on various equity markets worldwide.

Chances

- Attractive return contribution by harvesting the volatility risk premium.
- Smaller losses and signficalty faster recoveries compared to common stocks.
- Low correlation of return with traditional asste classes in the long term.
- Attractive performance even in sideways moving markets.

Risk / Return Indicator [11]

In addition to the general risks detailed in the Sales Prospectus, the volatility risk on the European stock market is of special importance.

The Lupus alpha Volatility Risk-Premium R fund is classified in category 3 because its unit price typically fluctuates rather minor and therefore both risks of loss and chances of gains can be correspondingly rather low.

For detailed information on opportunities and risks, please refer to the current Sales Prospectus.

Risks

- **Counterparty default risk:**
If counterparties and issuers do not fulfill or only partially fulfill their contractual payment obligations, this can result in losses for the fund. Even when securities are carefully selected, losses caused by the financial collapse of issuers cannot be ruled out.
- **Concentration risk:**
If investment is concentrated on particular assets or markets, the fund becomes particularly heavily dependent on the performance of these assets or markets.
- **Risks connected with derivatives transactions:**
Changes in the price of the underlying asset can devalue a derivative. If derivatives are used as part of the investment strategy, the Derivatives might have leverage effects that impact the fund more strongly than the underlying asset. When selling derivatives, there is the risk that the fund will suffer an indefinite loss amount.
- **Operational risk:**
The fund can become the victim of fraud, criminal acts pr errors by company employees or external third parties. Finally, managment of the fund can be negatively impacted by external events such as fires, natural disasters or similar.
- **Market risk:**
The performance of financial products depends on the development of the capital markets.
- **Liquidity risk:**
If securities are traded in a relatively narrow market segment, it can be difficult to resell them in situations where there is insufficient liquidity.

Legal Notice

- [1] Source: Lupus alpha; gross performance (BVI method): The gross performance considers all costs incurred at Fund level (e. g. management fee) and assumes reinvestment of any distributions. Costs incurred at customer level such as sales charge and securities account costs are not included. Unless otherwise specified, all indicated performance data show the gross performance. Please note: Past performance is not a reliable indicator for future performance.
- [2] Source: Lupus alpha; the net performance assumes a model calculation based on an invested amount of EUR 1,000, the maximum sales charge and a redemption charge (see master data). It does not include individual costs of the investor, such as a securities account fee. (To this effect, please refer to the price list of your securities account provider.) Please note: Past performance is not a reliable indicator for future performance.
- [3] Volatility: Volatility is the range of variation of a security price or index around its mean value over a fixed period of time. A security is regarded as volatile if its price fluctuates heavily.
Maximum loss 90 days: The maximum loss specifies the maximum potential loss an investor had to take in a 90 day timeframe.
VaR 95 – 10: Value at Risk defines the level of loss which will not be exceeded within 10 days with a probability of 95%.
VaR 99 – 10: Value at Risk defines the level of loss which will not be exceeded within 10 days with a probability of 99%.
Sharpe Ratio: Sharpe Ratio is the excess return (Fund performance less money market rate) in relation to the range of variation (volatility) and shows the yield of the Fund per risk unit. The higher the Sharpe Ratio, the more yield has been generated in relation to the risk incurred.
The maximum drawdown is the largest percentage drop in value in a given period of time. It measures the amount the fund falls from its highest point to its lowest point in the selected timeframe.
- [4] The initial sales charge is the difference between the sales price and the unit value. The sales charge varies depending on the type of the Fund and the distribution channel and usually covers advisory and distribution costs. The Distributor will demand the sales charge at its own discretion.
- [5] The management fee is the fee for managing the Fund and taken from the Fund's assets; it is paid to Lupus alpha for the management and administration of the Fund.
- [6] The performance fee is a performance-related remuneration depending on the performance or the achievement of specific objectives such as a better performance compared to a benchmark. The costs may also be levied if a pre-defined minimum performance has been achieved.
- [7] The hurdle rate means a specific minimum interest and/or profit threshold a Fund has to achieve in order to allow the investment company to participate in the Fund's profit.
- [8] Performance fees of investment companies are frequently bound by a high watermark - the all-time high of the Fund. This means that a commission entitlement arises only if that mark has been exceeded.
- [9] Distributing Funds do not reinvest the generated income, they pay out the income to the investor.
- [10] The correlation measures the strength of the statistical relationship between two variables. A positive correlation means "the more ... the more", a negative correlation means "the more ... the less". The value of correlation is in the range between -1 (completely opposed) and +1 (completely equal). Correlations are some kind of no-tice on but no evidence for causalities which mean proven cause-effect relation-ships.
- [11] The presentation shows the summary risk indicator (SRI) of the Fund's Key Information Document (KID) and does not include all possible risks. Funds are subject to market-related price fluctuations which may result in losses up to the total loss of the invested capital. For additional risks and detailed information on the summary risk indicator, please refer to the current Key Information Document. You may retrieve the Key Information Document and the current Sales Prospectus from our website at www.lupusalpha.de.
- [5] The fund takes sustainability-related risks into account when making investment decisions and is classified as a product under Article 6 of Regulation (EU) 2019/2088 on sustainability-related disclosure requirements in the financial services sector ("SFDR").

The Capital Management Company may also invest for the Fund more than 35% of the Fund's assets in debt obligations, note loans and money market instruments of one or several issuers (please refer to Section "Investment Limits for Public Issuers" in the Sales Prospectus).
